

DecodeLabs Data Analytics — Project 4

Data Visualization | Boardroom-ready visual storytelling from the same e-commerce dataset used in Projects 1–3

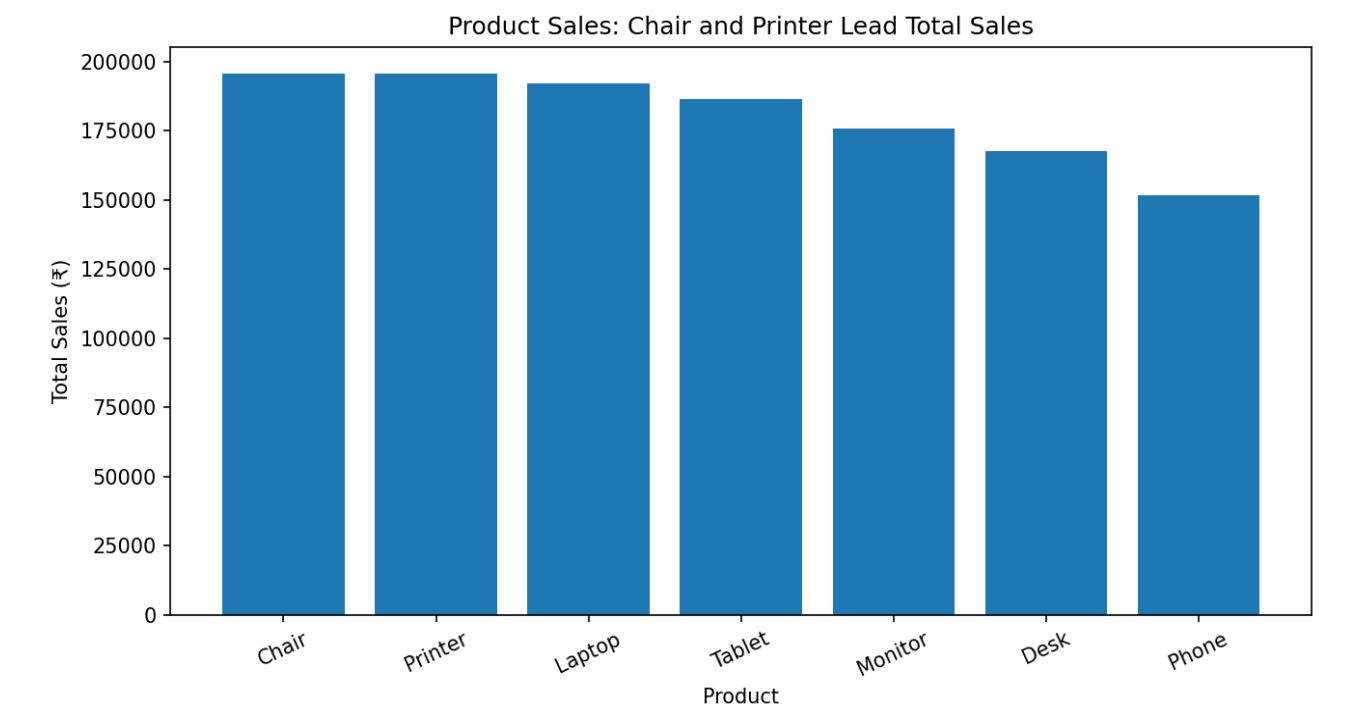

Metric	Value
Orders analyzed	1,200
Total sales	■1,264,761.96
Average order value	■1,053.97
Unique customers	1,189
Date range	2023-01-01 to 2025-06-30

Executive story

- Chair and Printer lead product sales and are separated by only a few rupees in total sales.
- Monthly sales fluctuate across the 30-month period represented in the dataset.
- Cancelled orders are the largest order-status group by count.
- Instagram produces the highest total sales among referral sources.
- Credit Card and Online are the two highest-sales payment methods and are relatively close.

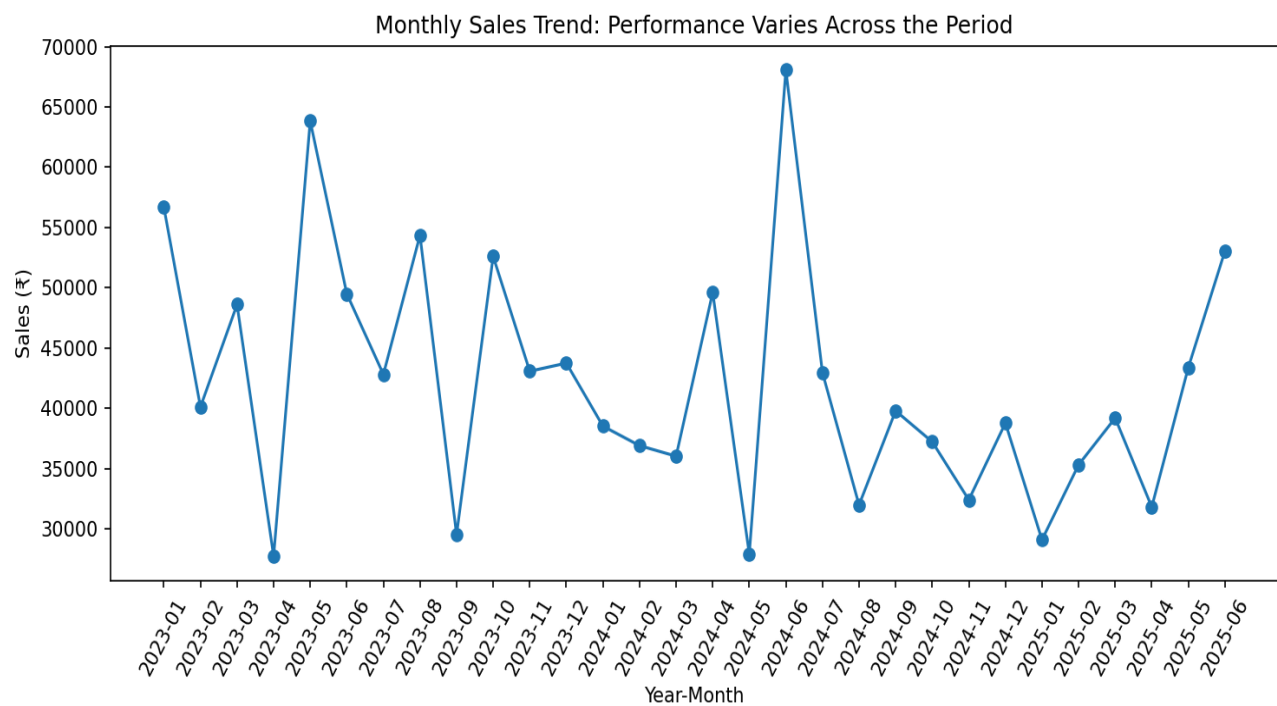

The project follows the training kit's visual-storytelling emphasis: define the insight before the chart, choose the visual according to the analytical question, maintain axis integrity, reduce chartjunk, and communicate a clear 'So What?'.

Product comparison: Chair and Printer are the leading products by total sales.

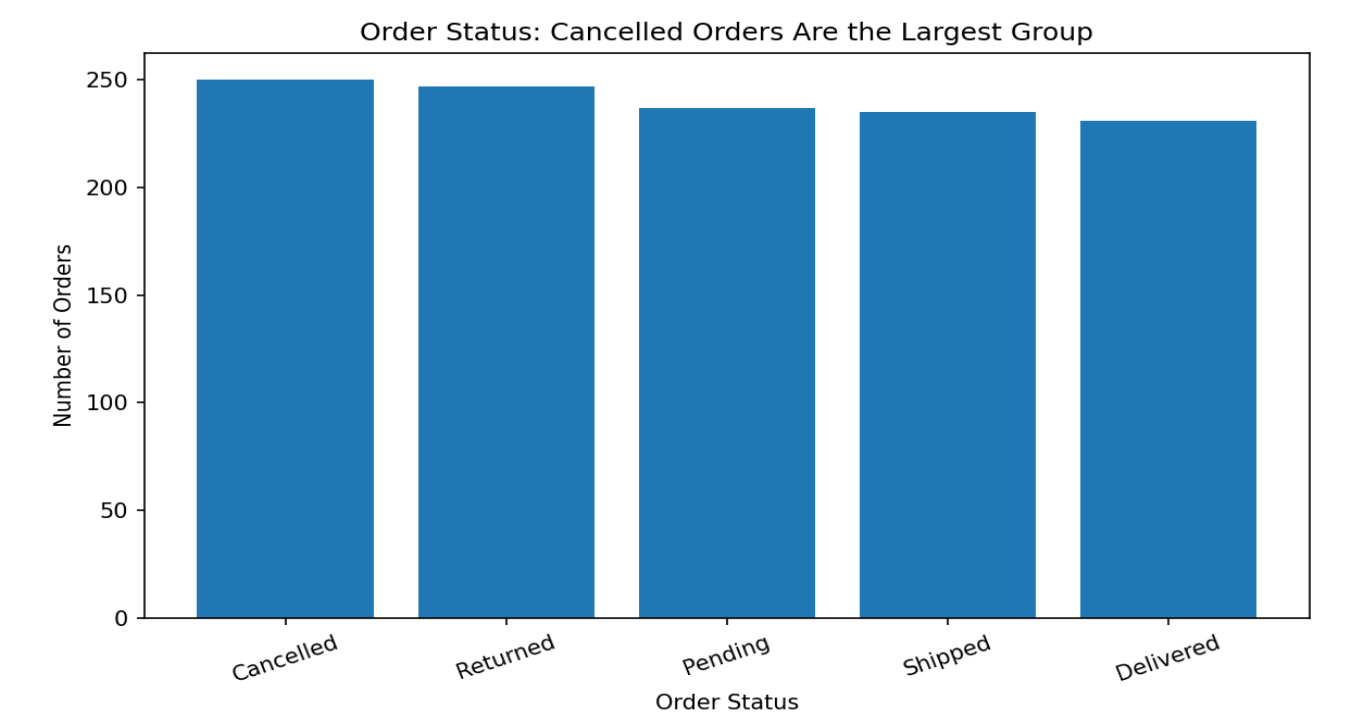

Interpretation boundary: these visuals are descriptive. They show what happened in the dataset, but they do not by themselves establish causal relationships.

Time trend: monthly sales vary throughout the Jan 2023–Jun 2025 period.

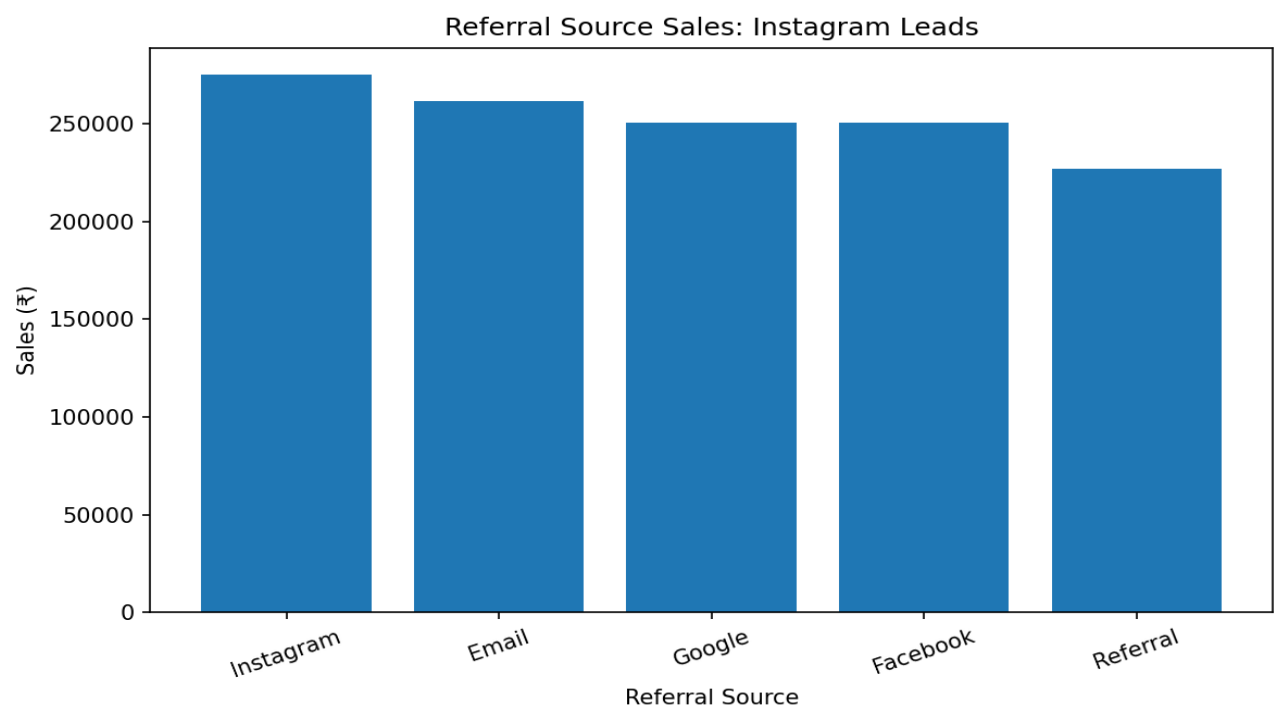

Interpretation boundary: these visuals are descriptive. They show what happened in the dataset, but they do not by themselves establish causal relationships.

Order-status comparison: Cancelled has the highest order count.

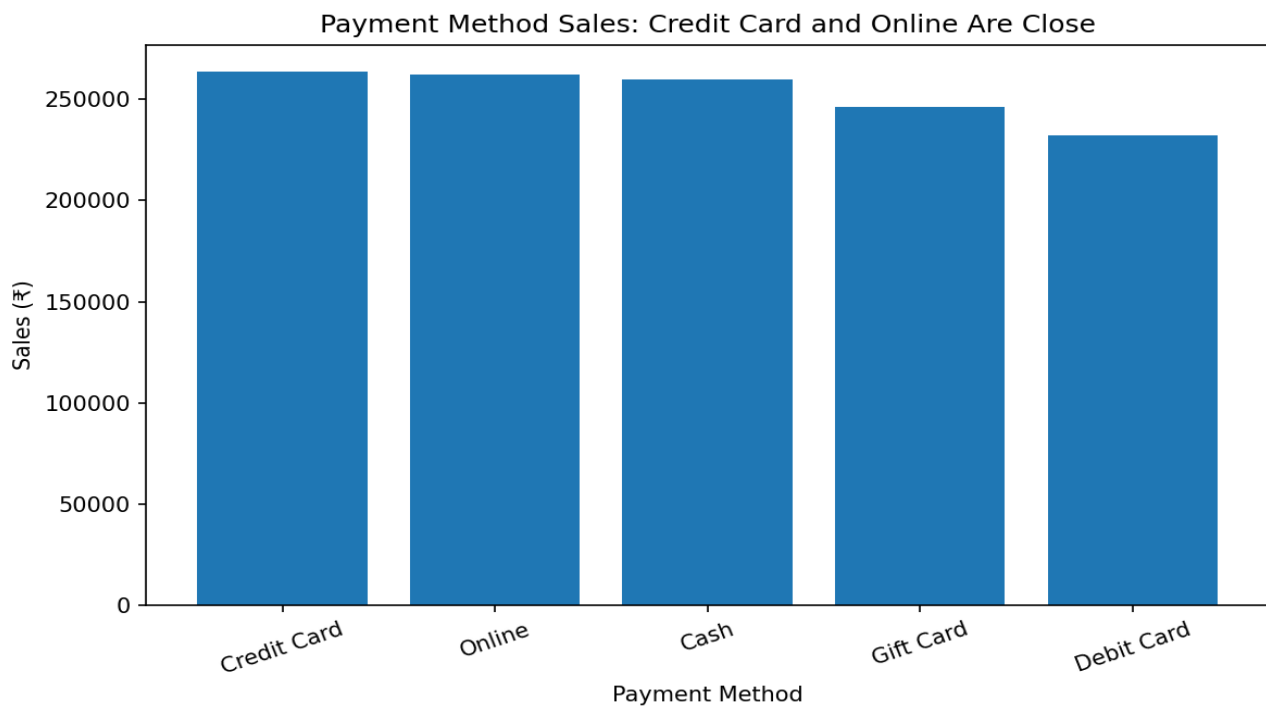

Interpretation boundary: these visuals are descriptive. They show what happened in the dataset, but they do not by themselves establish causal relationships.

Referral-source comparison: Instagram has the highest total sales.

Interpretation boundary: these visuals are descriptive. They show what happened in the dataset, but they do not by themselves establish causal relationships.

Payment-method comparison: Credit Card and Online are the two highest-sales methods.

Interpretation boundary: these visuals are descriptive. They show what happened in the dataset, but they do not by themselves establish causal relationships.
